

EXPERIMENT - 12

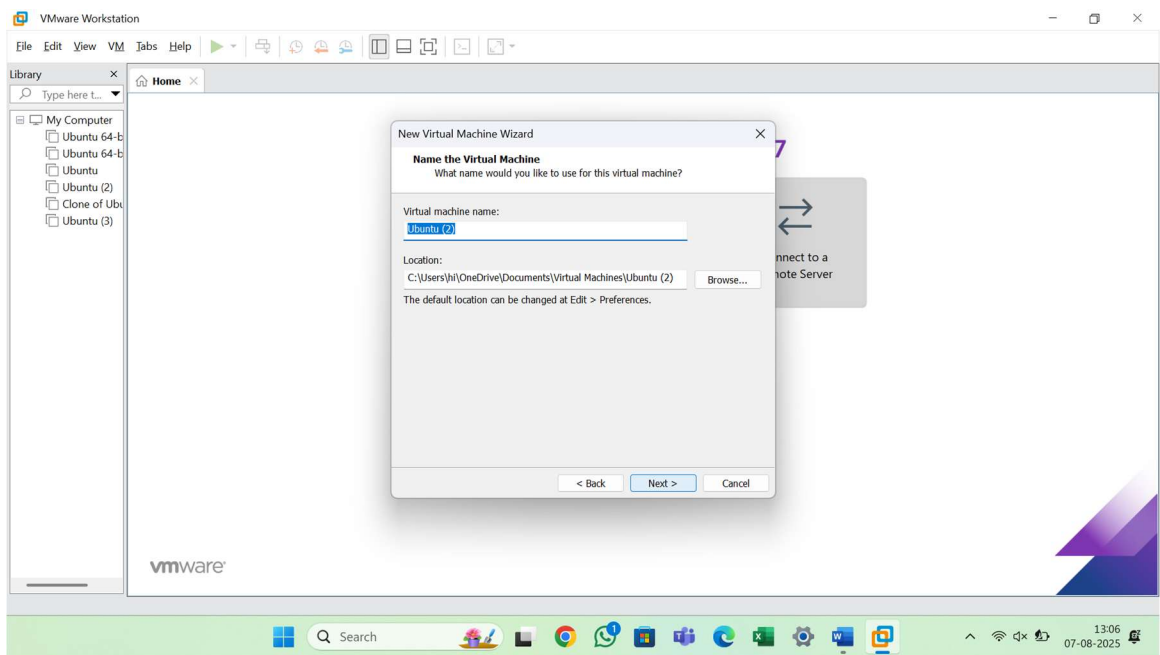

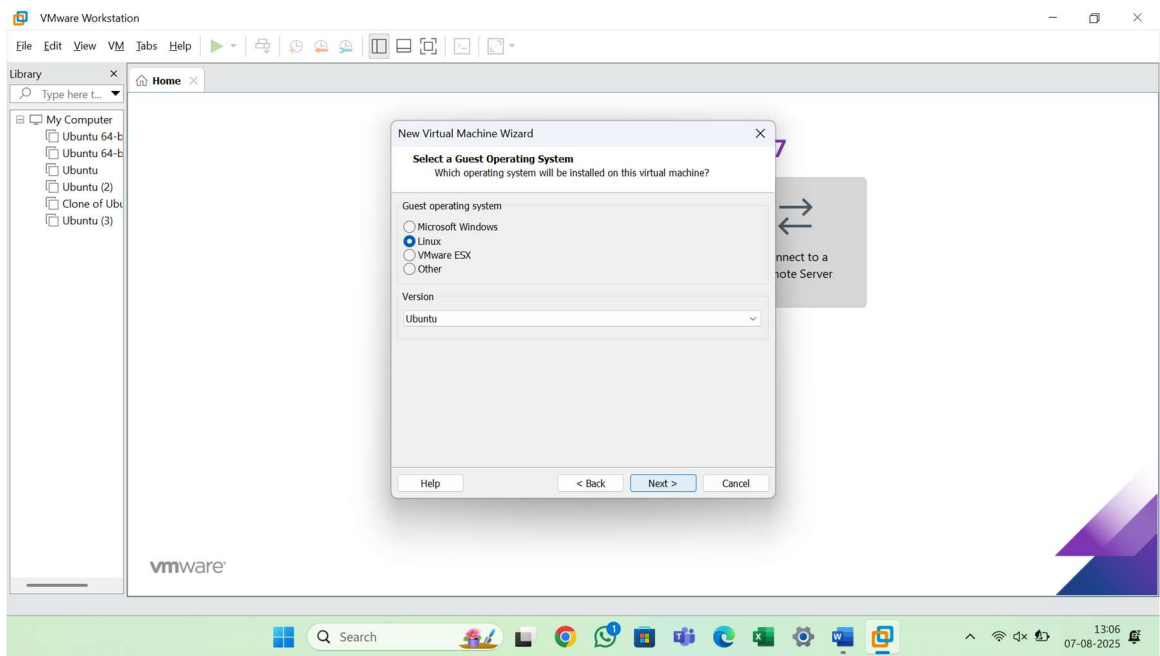

Aim

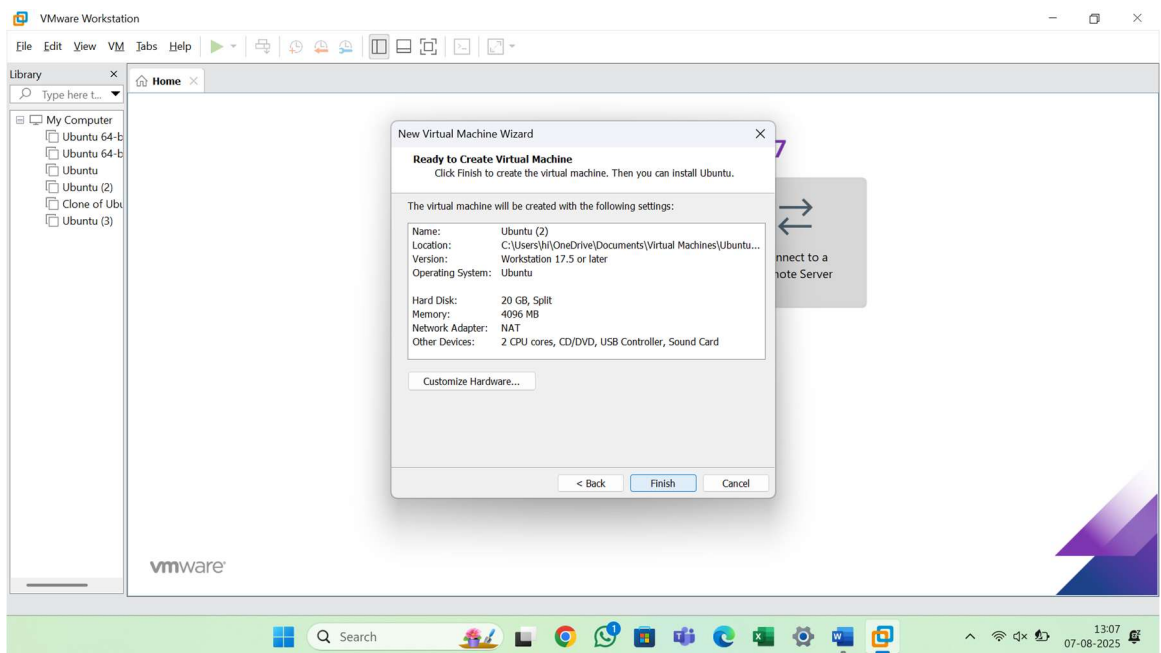

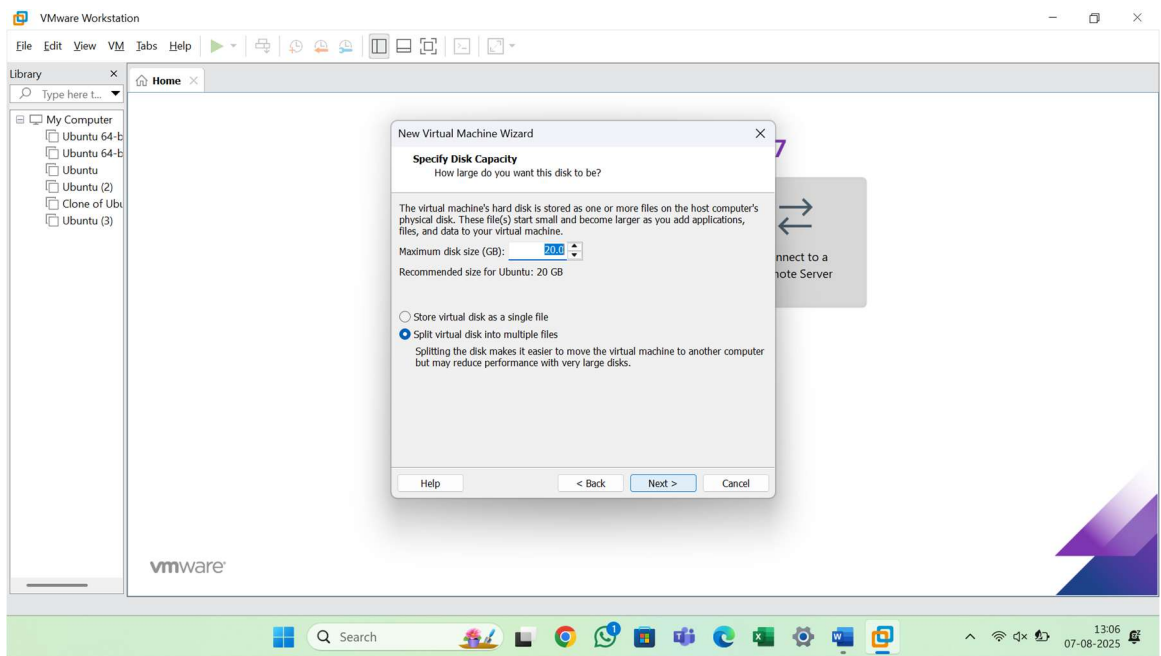

To demonstrate virtualization by installing a Type-2 Hypervisor (VMware Workstation), creating and configuring a Virtual Machine (VM) image with a host operating system (Windows/Linux).

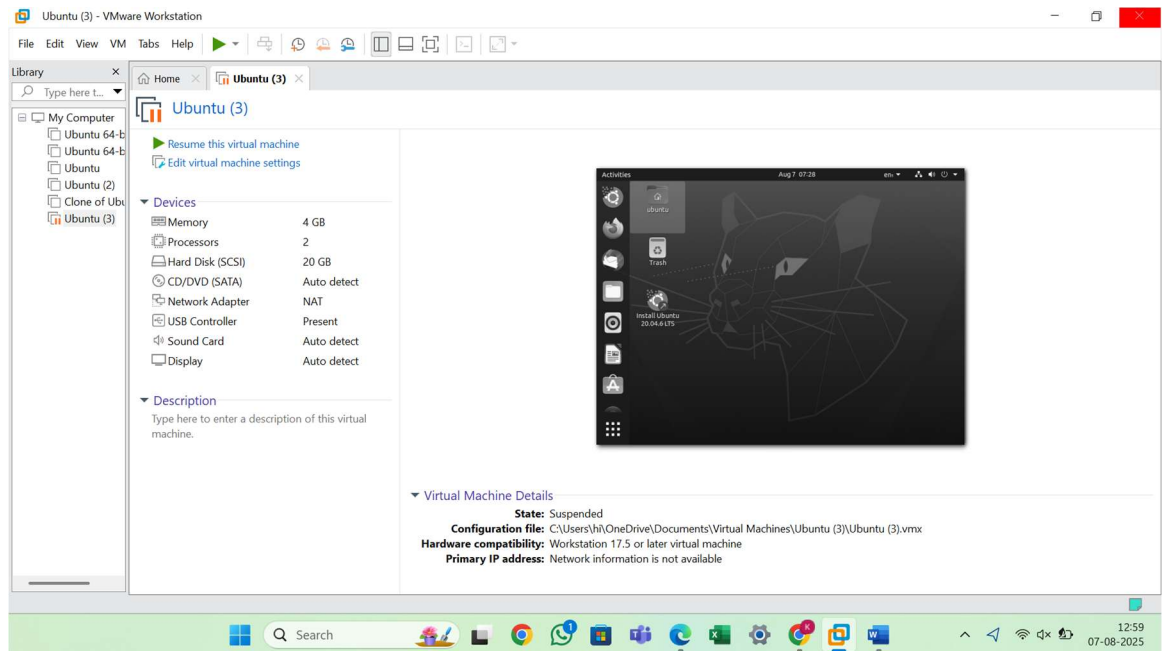

Procedure

1. Download and install VMware Workstation Player from the official website: <https://www.vmware.com/products/workstation-player.html>.
2. Launch VMware Workstation Player after installation.
3. Click on 'Create a New Virtual Machine'.
4. Choose the installation method for the guest OS (Installer disc/ISO image).
5. Select the ISO file of the desired operating system (e.g., Ubuntu or Windows).
6. Name the virtual machine and choose a storage location.
7. Allocate disk space (e.g., 20 GB or more) and memory (e.g., 2–4 GB RAM).
8. Configure the network settings (NAT or Bridged).
9. Start the VM and install the guest operating system by following the on-screen instructions.
10. After installation, install VMware Tools for better integration and performance.
11. Configure additional settings like screen resolution, shared folders, and drag-and-drop functionality.

Result

Successfully installed and configured VMware Workstation Player (Type-2 Hypervisor) on the host machine. A virtual machine was created and a guest operating system (Ubuntu 22.04 LTS) was successfully installed and configured. VMware Tools were installed to enhance VM performance.
